

Preface

This volume contains the proceedings of the Third international Workshop on Software Verification and Validation (SVV). SVV took place on October 31, 2005 as a pre-conference satellite workshop of the Seventh International Conference on Formal Engineering Methods (ICFEM) that took place at the University of Manchester (UK), November 1—4, 2005.

The goal of SVV is to promote discussion on novel methodologies for software verification as well as study novel combinations of (known) methodologies. An outstanding example of a combined verification methodology is the recent research direction that combines abstraction (of infinite-state programs into finite-state ones) with model checking (of finite-state systems). There is a growing conviction in the research community that such hybrid methodologies are imperative for the process of analyzing full-fledged software systems.

The SVV 2005 program consisted of 6 exciting papers. The topics addressed by the accepted contributions covered theoretical techniques as well as practical methods/case studies for verification of software systems. Prof. Farn Wang from the National Taiwan University delivered an invited talk titled “Automatic Test Case Generation with Region-Related Coverage Annotations for Real-time Systems”.

We would like to thank the program committee and all the referees for their assistance in selecting the papers and the local organizers for providing tremendous help with the coordination of the workshop.
